Software for material and tool management

Release notes – version 4.0

MIRA Software is a product of **IZIT bv**

Dokter Armand Rubbensstraat 1

9240 Zele

RELEASE NOTES

1. Forms

The old limited checklists are replaced by fully-fledged (multilingual) forms. The user can now:

- retrieve his complete checklist history as a form.

- decide when his form should be shown or created. This can be done when checking-out, checking-in, sending for maintenance and taking back from maintenance.

- create a new form with title, description and question set in the different languages (one for all languages, or one for each individual language). This can be done manually or via import..

- add questions to a form where the answer is no longer just 'yes/no', but can also be text, date, number or a multiple-choice option.

- in case of a question of the type selection list, the user can define the options himself or he can create the selection list via a known input screen and reuse it in multiple forms.

- edit a question set and then see it as a new version. There is a version control in forms. More information can be found in the manual.

- link a form to an item or a maintenance condition.

- set whether a form can be postponed and whether a question can be left blank. Incomplete forms can be processed later via the consultation screens.

2. Feature requests

- Possibility to search on the responsible of an item in stock consultation.

- Possibility to filter stock that is currently checked out on a project in the maintenance screens.

- iOS app now supports Dark mode.

- Possibility to indicate if a stock status should be overwritten automatically.

- E-mail address of employee can now be added as search field and column in check-out consultation.

- User can import multiple documents and images for certificates, employees, suppliers, items and stock.

3. General improvements

- It is no longer necessary to connect to the database directly from the client.

- Performance improvements when starting up for the first time on the client after an update.

RELEASE NOTES

4. Fixed bugs

- It is no longer possible to create stock statuses with duplicate codes.

- Current location of unique stock was not displayed correctly when it was moved.

- Explanation of obligation to fill in items is now also translated.

- Dialog box for adjusting a check-out is displayed correctly on any screen resolution.

- Possibility to take an item back from maintenance via barcode.

- Search in reservations on item now shows the correct reservations.

- Stock status of an item in a composed item can now be adjusted.

- Rights on item are checked correctly for maintenance and reservations.

- Prices of maintenance conditions are correctly stored.

- Possibility to export items with query from input screen for items.

- No error message is displayed anymore after creating a maintenance condition.

- Documents or images with the same name no longer overwrite the original file.

- Import of data now takes into account already deleted data.

- End date of the certificate is set correctly when linking to an employee or supplier.

- Value until next maintenance is now correctly calculated in each scenario.

- Warning when an assigned certificate is deleted.
